

# How to Install Windows 9x Cursors

## An easy to follow tutorial by Quentin Christensen

The cursors on my web-site – as with many downloads from many web-sites, are in ZIP format. In order to use them, you need a program to *unzip* the files, so that they can be used. The reason they are 'zip'ped is because 'zip'ping them makes the download smaller (and quicker) and allows putting everything which is related into only one file, where previously there may have been many, even sub-directories.

How to unzip files depends on the unzip program you use, and I won't go into that here, except to say to remember where you unzip the cursors to, as you will need to know this.

OK, let's go!

CONTENTS:

[Step 1 – Open 'Control Panel'](#)  
-----

[Step 2 – Open 'Mouse' Properties](#)  
-----

[Step 3 – Go to 'Pointers' tab](#)  
-----

[Step 6 – Finish](#)

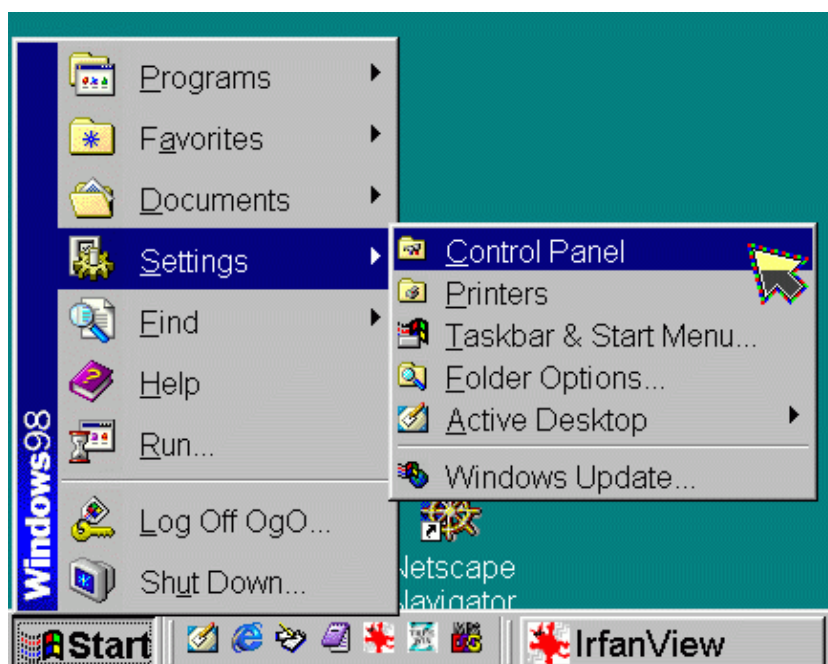

### *The Web Site:*

This document was created from the web-page '*How to Install Windows 9x Cursors*', written by Quentin Christensen: <http://qjc.cjb.net/cur-help.html>.

The large, easy to see Windows 9x Cursors themselves are available from: <http://qjc.cjb.net/cursors.html>

## Step 1 – Open 'Control Panel'.

First of all, you will need to open the windows control panel. You do this by clicking on the start menu (lower left hand corner of the screen), then on 'Settings', then on 'Control Panel' – as shown below:

---

[Back to top.](#)

## Step 2 – Open 'Mouse' Properties.

Next you need to open the 'Mouse' section, by double clicking on it. Again, shown below:

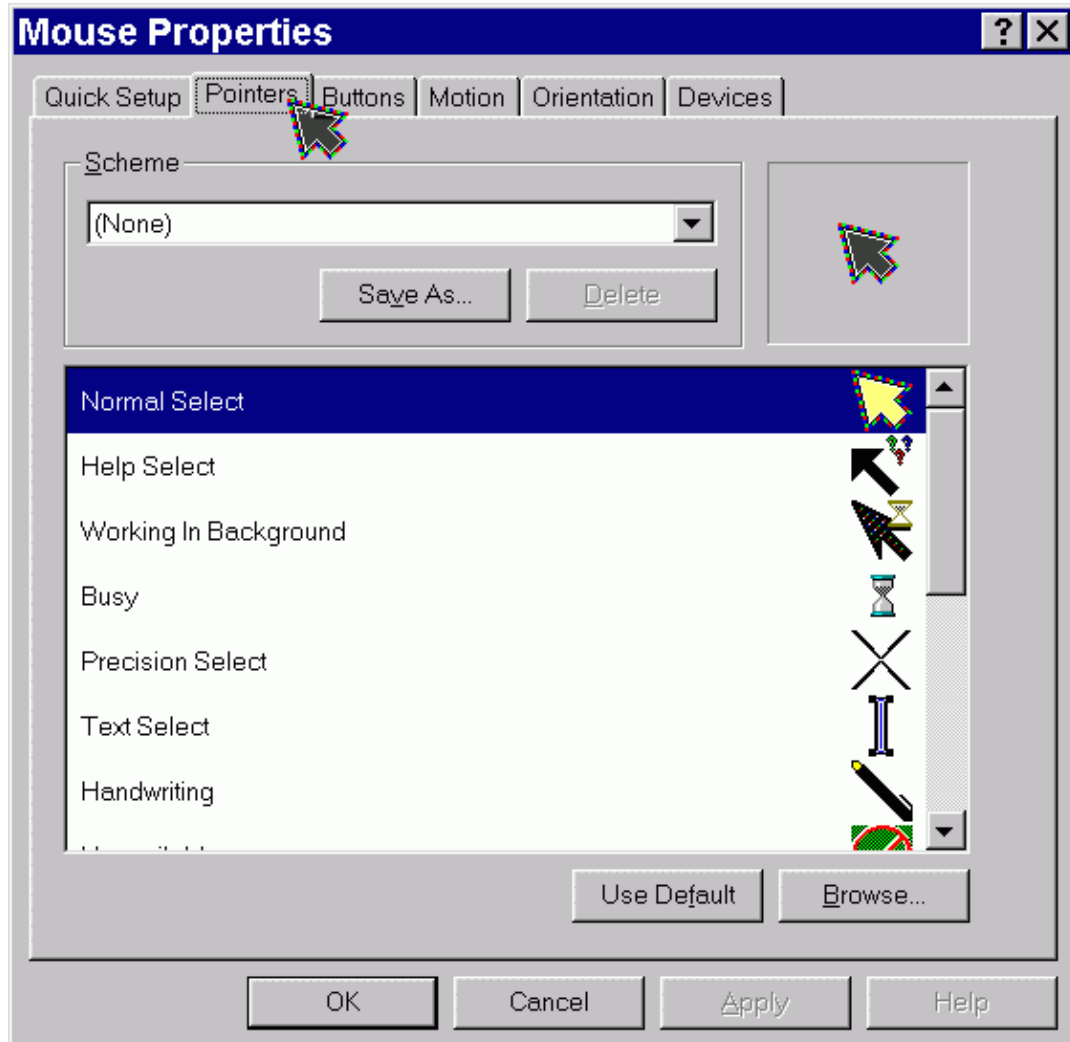

---

[Back to top.](#)

### Step 3 – Go to 'Pointers' tab.

Next, click on the tab labeled 'pointers' up the top (second from the left), see below:

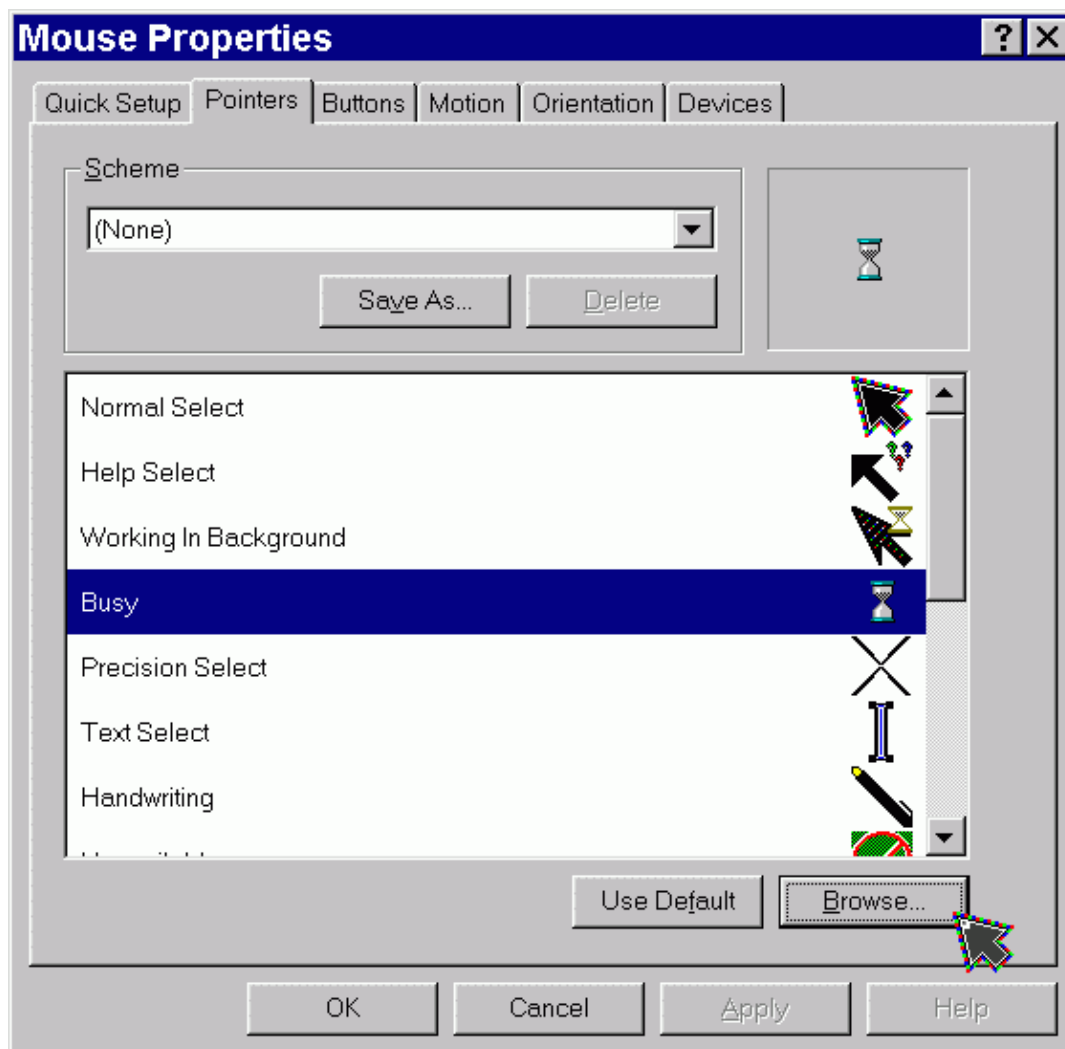

---

[Back to top.](#)

## Step 4 – Select cursor to change.

Now you need to click on the cursor you want to change in the list (in this case the 'busy' cursor), and click on the 'browse' button:

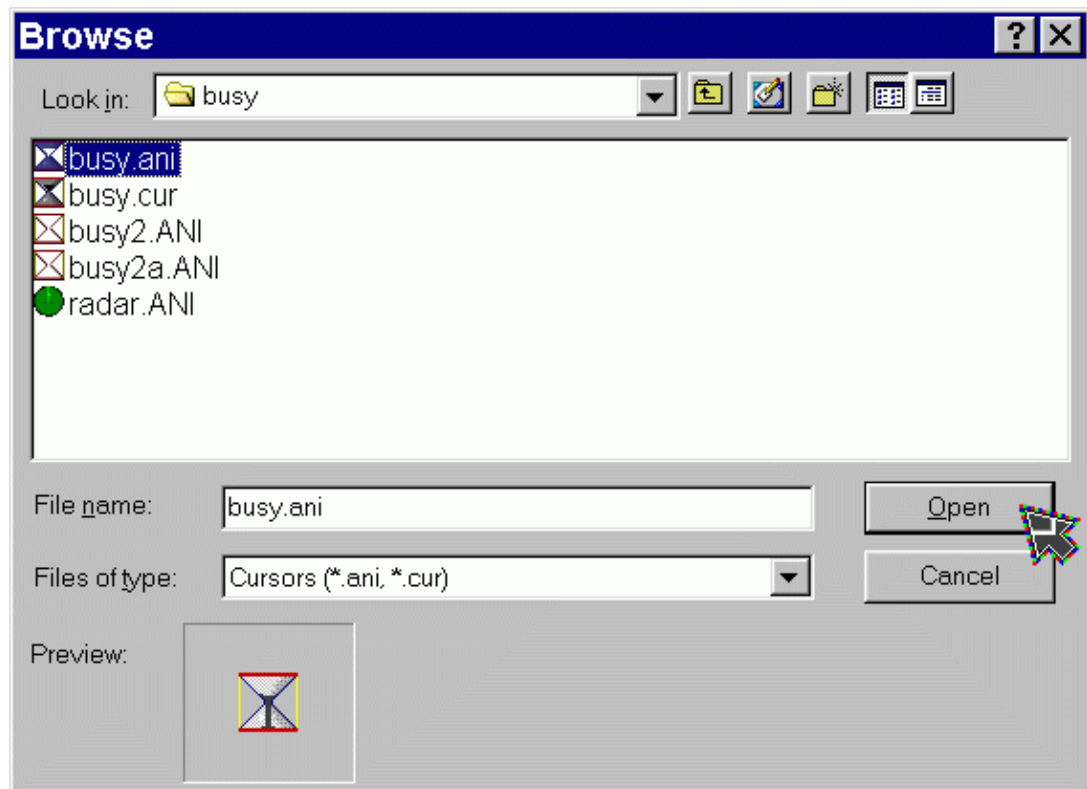

---

[Back to top.](#)

## Step 5 – Select new cursor.

Move to the directory where you unzipped the cursor file you wish to use to and select it. Press Ok:

---

[Back to top.](#)

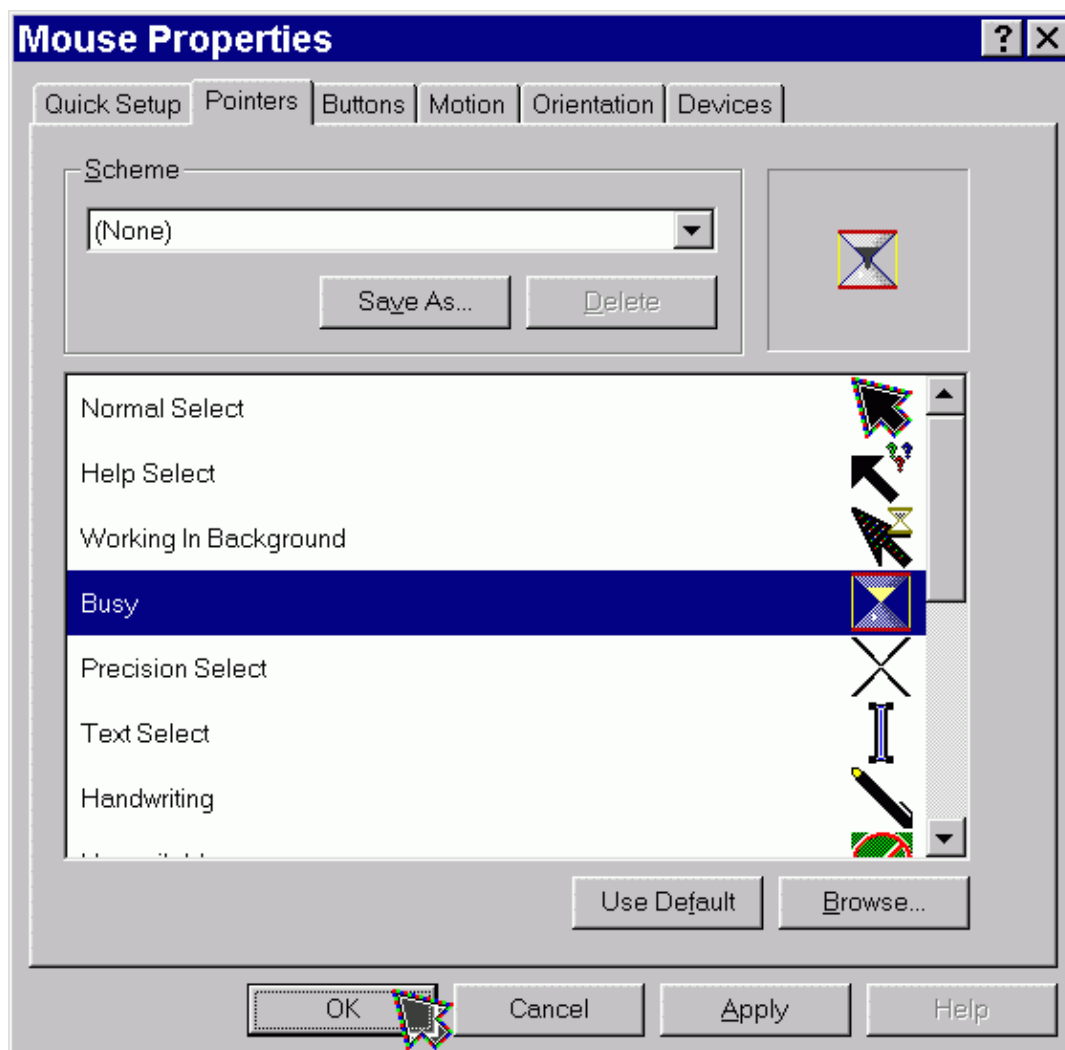

## Step 6 – Finish.

The image of the cursor you selected should now appear in the list of cursors as the normal cursor.

If you wish to change another cursor, [go back to step 4](#).

If you want to make your cursor active, but may want to change another cursor, click on the 'apply' button to make the new cursor(s) active and leave the mouse options open, you can do your normal work and 'test drive' your cursor(s), but have the mouse options open to CTRL-TAB back to if you want to change it.

If you have finished with the mouse options screen, click on 'OK' to make the new cursor(s) active and close the mouse options:

That should do it. your new mouse pointer should now active!

If you have a suggestion, or need any further help, please feel free to [email me at cursors@qjc.cjb.net](mailto:email_me_at_cursors@qjc.cjb.net).

Regards, Quentin Christensen.
